Recognizing and writing fractions

In daily life, we see whole objects and their parts.

For example:

It is a whole apple.

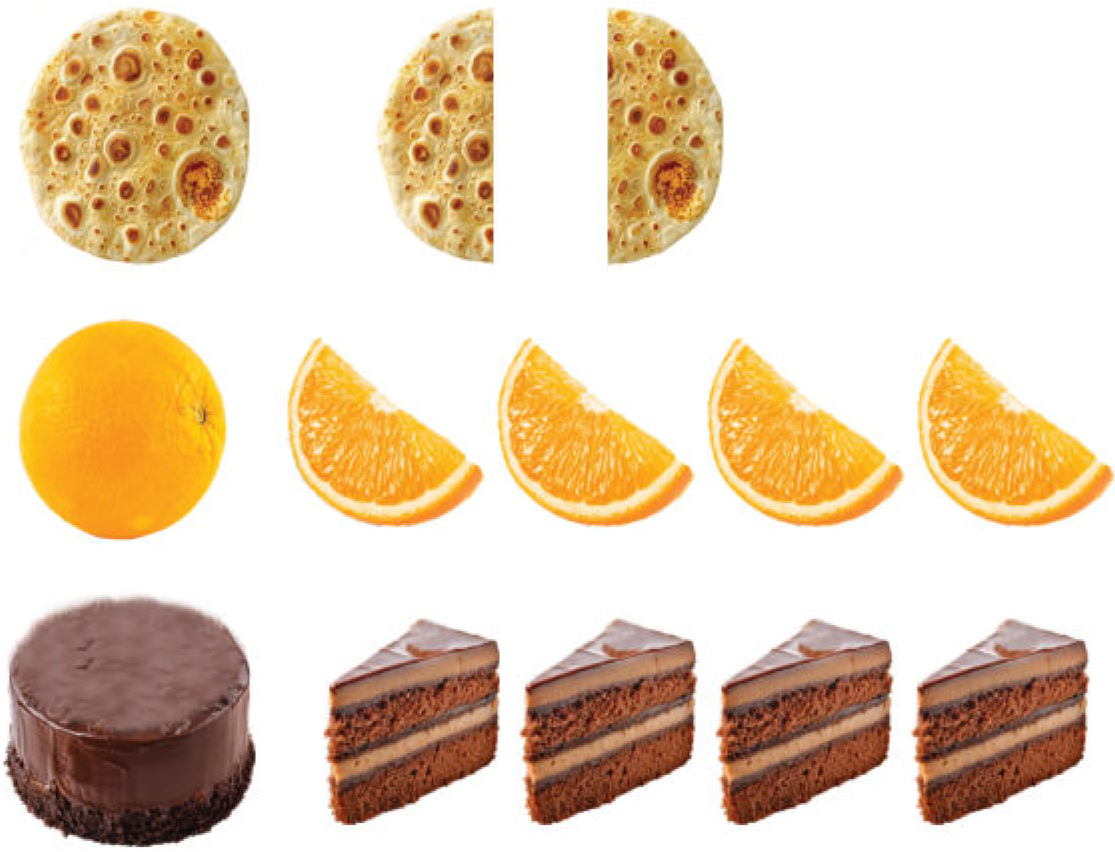
These are parts of the apple. Each part represents a fraction.

Fraction is a part of whole

Some whole objects and their fractions are shown below.

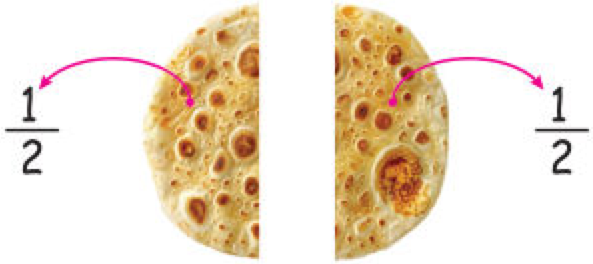
Whole

Fractions



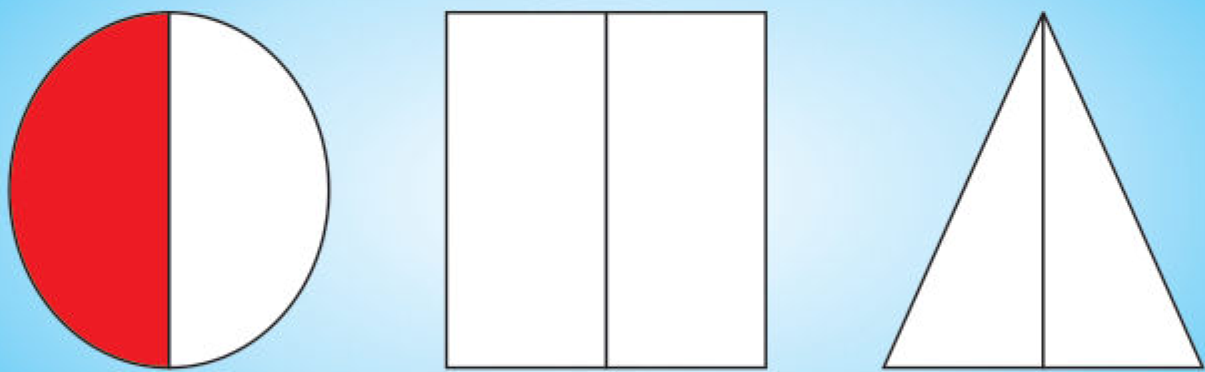
If we divide a whole in two equal parts or fractions, each part or fraction of the whole represents an HALF

A Half is written as $\frac{1}{2}$



Activity

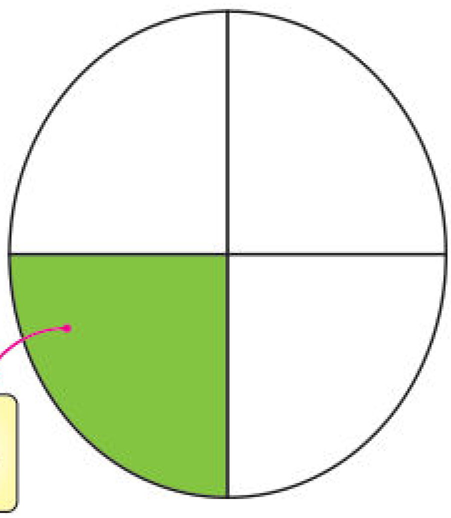
Colour one half and write it.



$\frac{1}{2}$

If we divide a whole in four equal parts. Each part or fraction represents quarter.

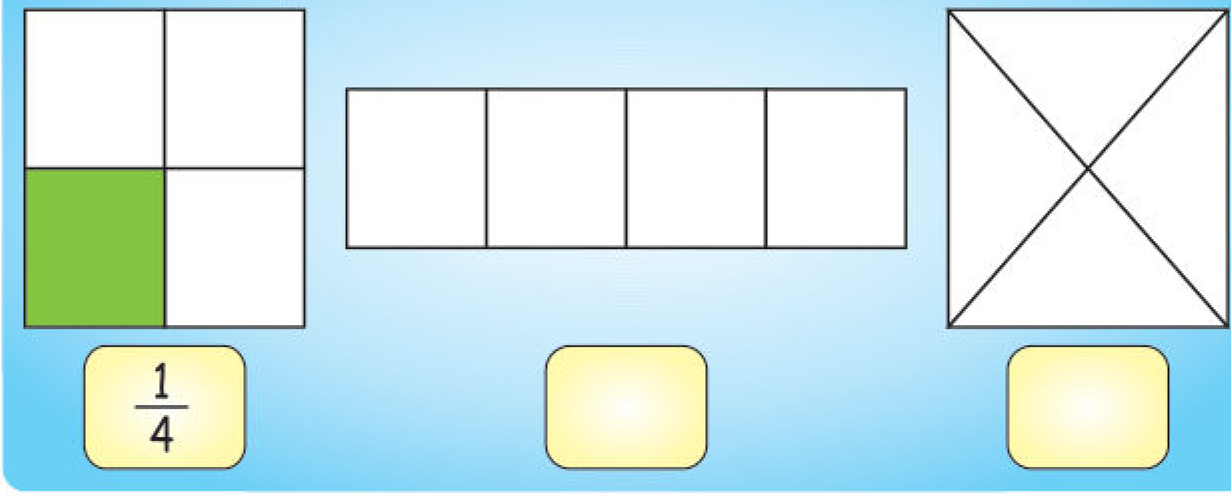
A quarter is written as $\frac{1}{4}$



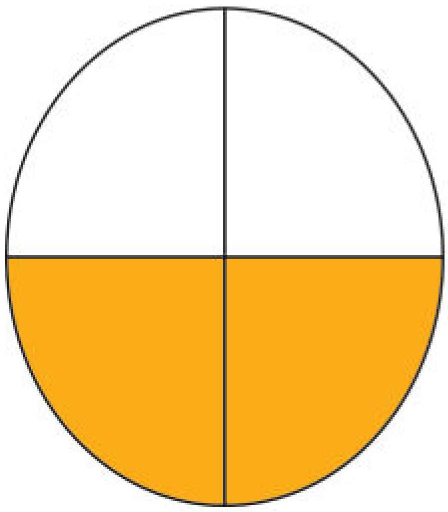
Quarter $\frac{1}{4}$

Activity

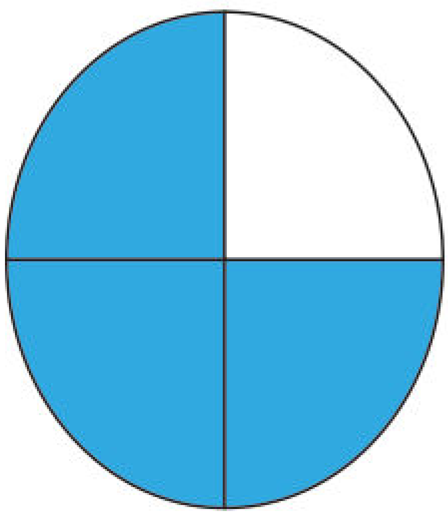
Colour a quarter and write it in the box.



We write two quarters as $\frac{2}{4}$

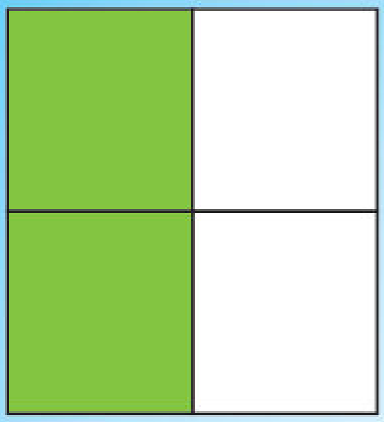


We write three quarters as $\frac{3}{4}$

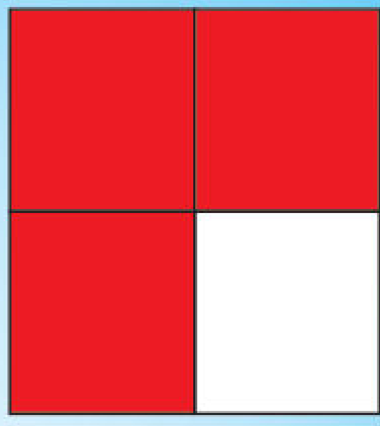


Activity

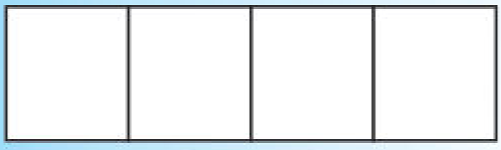
Colour two quarters and three quarters and write them.

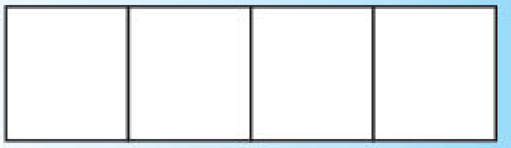


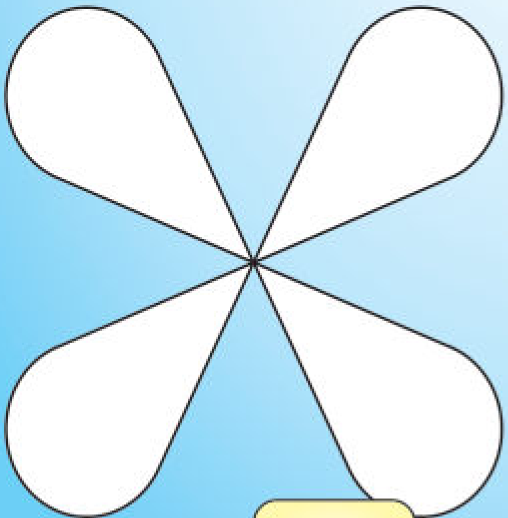
$\frac{2}{4}$

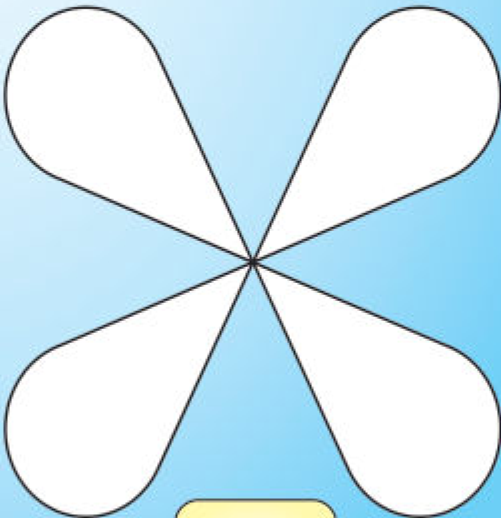


$\frac{3}{4}$



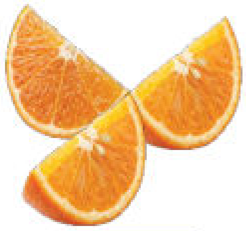






Exercise 1

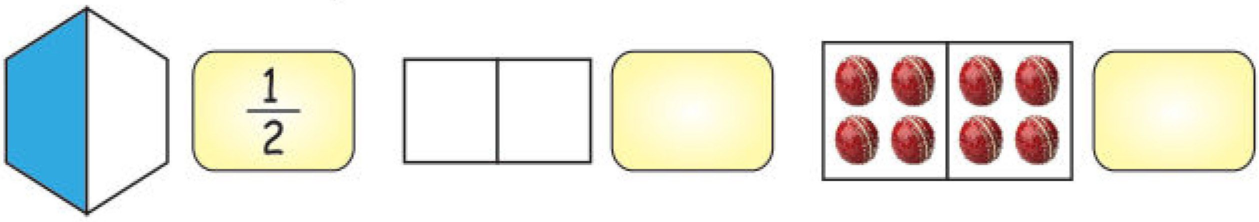
1. Tick ✓ the whole objects and cross ✗ the fractions.



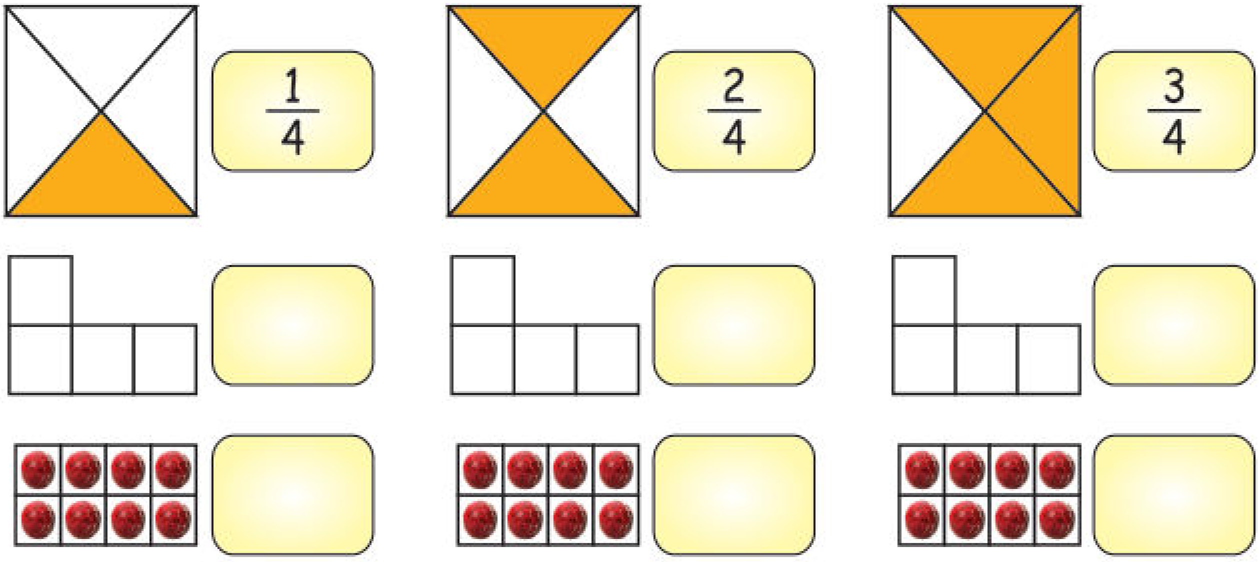
2. Match the following.

Half	$\frac{2}{4}$
Quarter	$\frac{3}{4}$
Two quarters	$\frac{1}{2}$
Three quarters	$\frac{1}{4}$

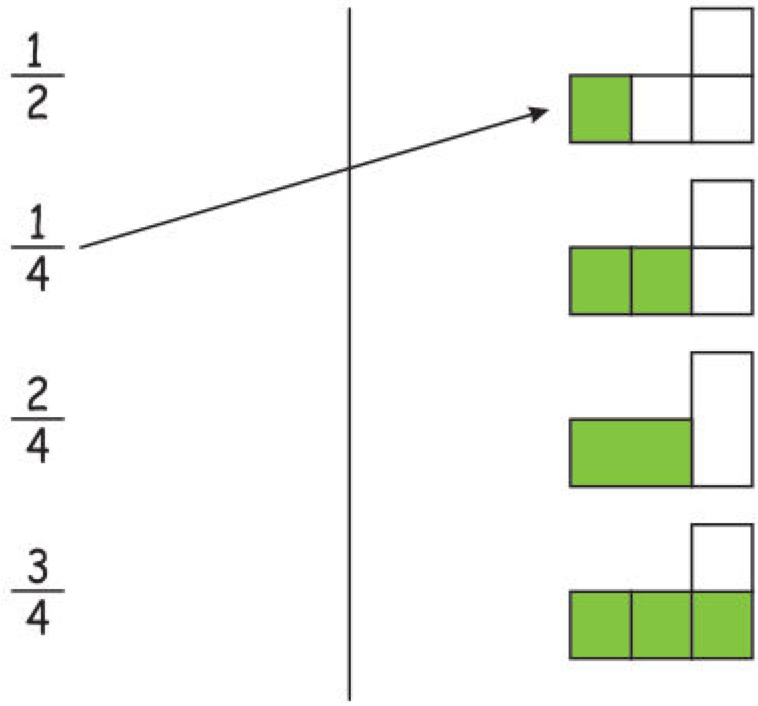
3. Colour half portion and write it in the box.



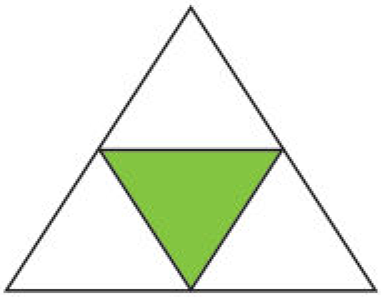
4. Colour one quarter, two quarters and three quarters. Also write it in the box.

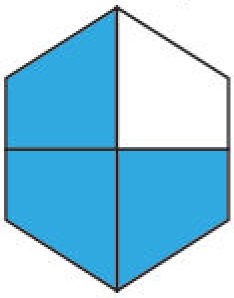


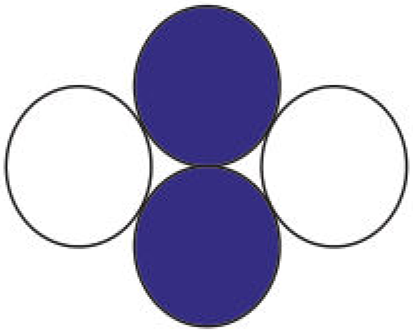
5. Match the following.

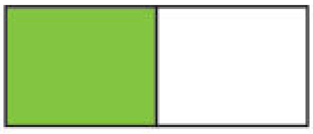


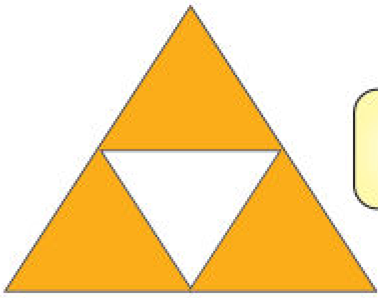
6. Write the fractions for coloured parts in the given boxes.

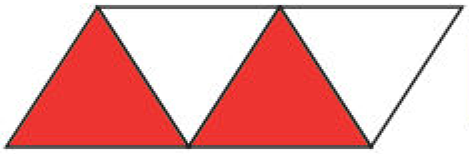


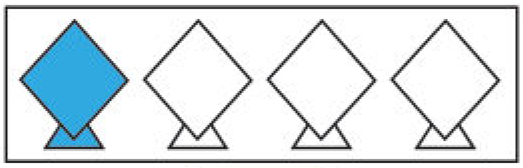


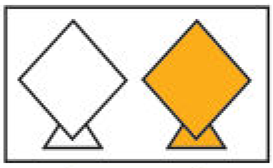


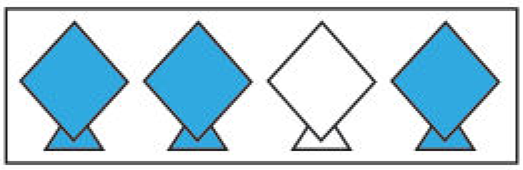


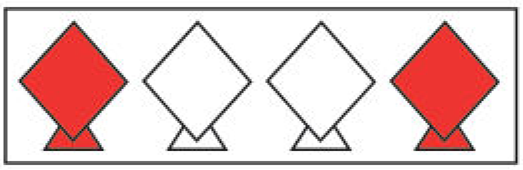












Adding and subtracting simple fractions:

A simple fraction has two parts as shown below

$\frac{3}{4}$ — Numerator (3), Denominator (4)

Numerator:

It is the number at the top.

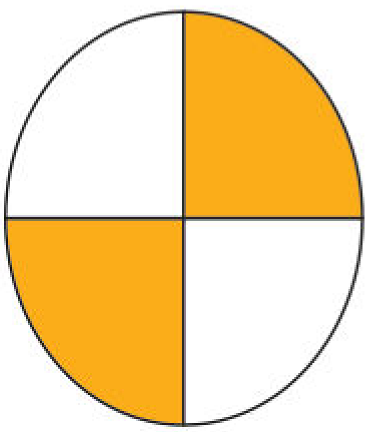
Numerator shows parts to be taken

Denominator:

It is the number at the bottom.

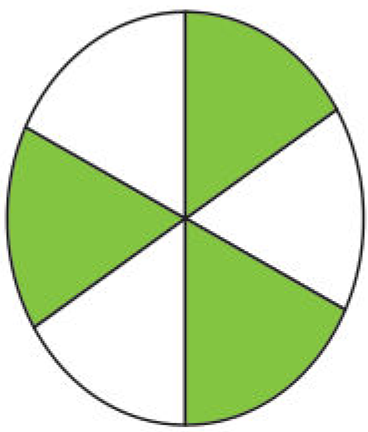
Denominator shows equal parts

Some simple fractions are given as under



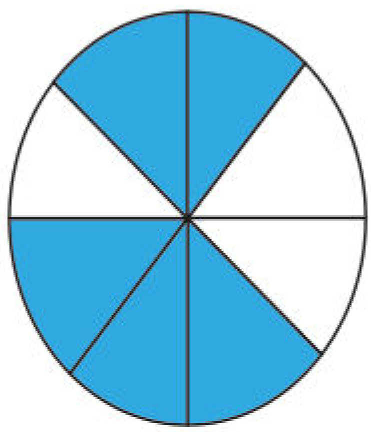
$\frac{2}{4}$

Numerator = 2
Denominator = 4



$\frac{3}{6}$

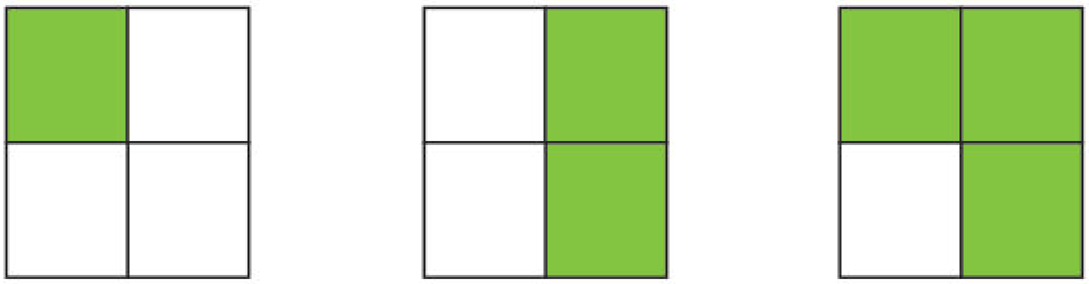
Numerator = 3
Denominator = 6



$\frac{5}{8}$

Numerator = 5
Denominator = 8

We can add simple fractions with same denominators as explained below.



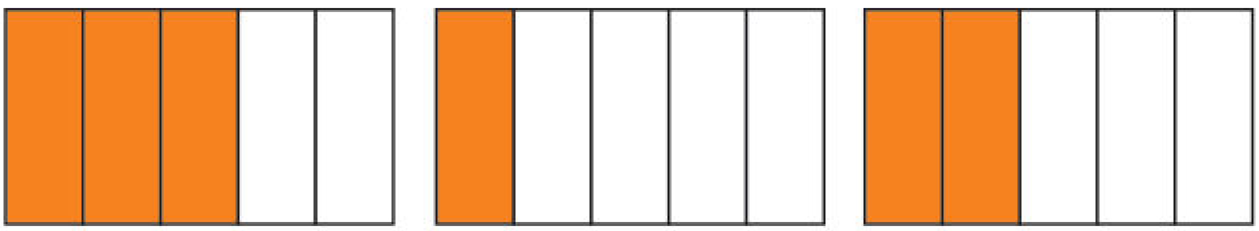
$$\frac{1}{4} + \frac{2}{4} = \frac{3}{4}$$

We only add numerators when denominators are same.

Similarly $\frac{2}{7} + \frac{3}{7} = \frac{5}{7}$

and $\frac{4}{8} + \frac{2}{8} = \frac{6}{8}$

We can subtract simple fractions when denominators are same as explained below



$$\frac{3}{5} - \frac{1}{5} = \frac{2}{5}$$

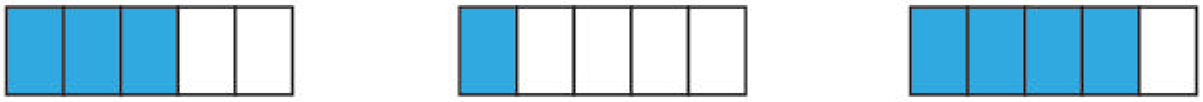
We only subtract numerators when denominators are same.

Similarly $\frac{4}{7} - \frac{3}{7} = \frac{1}{7}$

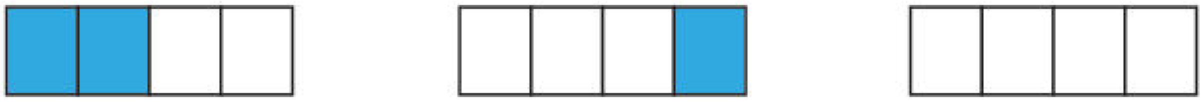
and $\frac{5}{8} - \frac{2}{8} = \frac{3}{8}$

Exercise 2

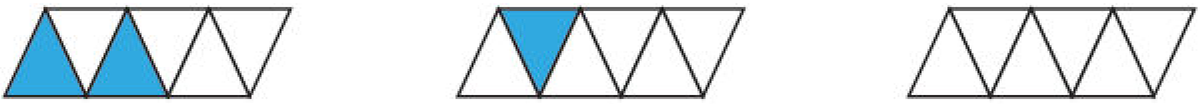
1. Add the following.



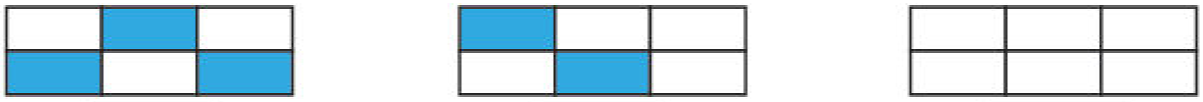
$\frac{3}{5}$ + $\frac{1}{5}$ = $\frac{4}{5}$



+ =



+ =

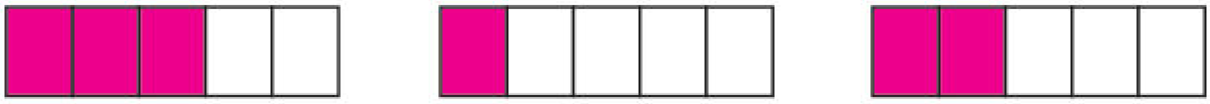


+ =

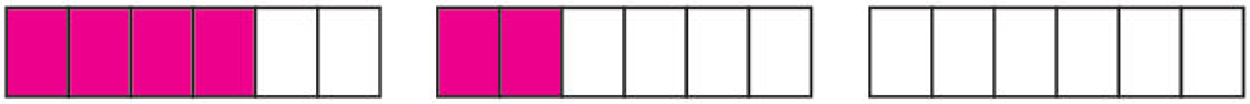
2. Match the following.

$\frac{2}{5} + \frac{1}{5}$	$\frac{3}{4}$
$\frac{3}{7} + \frac{2}{7}$	$\frac{5}{6}$
$\frac{1}{4} + \frac{2}{4}$	$\frac{3}{5}$
$\frac{2}{6} + \frac{3}{6}$	$\frac{5}{7}$

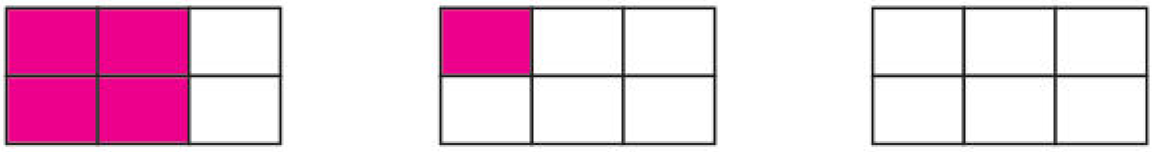
3. Subtract the following.



$\frac{3}{5}$ - $\frac{1}{5}$ = $\frac{2}{5}$



___ - ___ = ___



___ - ___ = ___

4. Match the following.

$\frac{5}{7} - \frac{2}{7}$	$\frac{4}{8}$
$\frac{4}{5} - \frac{1}{5}$	$\frac{2}{9}$
$\frac{6}{8} - \frac{2}{8}$	$\frac{3}{5}$
$\frac{5}{9} - \frac{3}{9}$	$\frac{3}{7}$

Unit 5

ALGEBRA

Student Learning Outcomes:

At the end of the unit, Students will be able to:

- ✓ Identify and explain repeating patterns with two core elements through pictorial and/ or visual representations e.g.△○△○△○
- ✓ Identify and represent a repeating pattern using colour, size, shapes, and letters through pictorial illustration eg.,○▮○▮○▮
